Why Bird Control Matters in Dubai

Dubai's warm climate and rapid urban growth have made bird infestations — especially pigeons, mynahs, and sparrows — a serious problem for homes, hotels, warehouses, and commercial buildings. Droppings damage property, spread disease, and cause costly repairs.

1. Bird Spikes

Stainless steel or polycarbonate spikes are installed on ledges, parapets, and AC units. They physically prevent birds from landing. Best for pigeons on flat surfaces.

2. Bird Netting

Heavy-duty UV-resistant netting blocks birds from entering open areas — courtyards, balconies, warehouses, and rooftops. Long-lasting and invisible from a distance.

3. Bird Wire Systems

Tensioned stainless wire on springs runs along ledges creating an unstable landing surface. Discreet, elegant — ideal for heritage buildings and hotels.

4. Electric Shock Track

Low-voltage electric tracks deliver a harmless shock that conditions birds to avoid the surface. Safe for birds, humans, and pets. Ideal for serious infestations.

5. Bird Repellent Gel

A transparent, sticky gel applied to surfaces creates an uncomfortable surface for birds. Non-toxic and weather-resistant — great for signs, HVAC, and ornaments.

Method	Best For	Lifespan
Bird Spikes	Ledges, Parapets	10+ Years
Bird Netting	Open Areas, Rooftops	5–8 Years
Bird Wire	Hotels, Heritage Buildings	8–10 Years
Electric Track	Severe Infestations	5–7 Years
Repellent Gel	Small Surfaces, Signs	1–2 Years
